

MAILCHECK / CLIENT GUIDE

How to check your email delivery

Run this test yourself from the mailbox and email app or sending service you want checked. No account is needed to run MailCheck.

01 Open MailCheck

Visit togethia.tools/mailcheck/ when you are ready to send your test message.

02 Generate your probe address

Complete the maths check and select Generate a new test. Copy the unique check-...@probe.togethia.tools address shown on the page. Keep the page open and send before its expiry countdown reaches zero.

03 Choose who receives the report

Turn on Only send report to sender if you want the PDF result sent only to the sending address. When this option is off, toolbox@togethia.net also receives a copy.

04 Send a new email yourself

In the mailbox or sending service you want tested, create a new message to the probe address. Use a subject such as MailCheck test and a short, non-sensitive message. Do not reply to this instruction email or forward an existing message: the test needs a fresh email sent through your normal sending route. No attachments, passwords or confidential information are needed.

05 Read and share your results

Return to the open MailCheck page. Results appear automatically after your message arrives and is analysed. Download the PDF report there; it is also emailed to the message sender. If someone requested the check, share that report with them.

Address expired? If the probe address expires, return to MailCheck, complete the maths check and generate a new test address before sending again. An old probe address cannot be reused.

Message content is retained only long enough to produce the report. The result is a point-in-time check, not a guarantee that every recipient will accept your email.
